# Weather Data APIs

Last Updated: 2026-01-13

With Environmental Intelligence Suite, you get access to a rich set of weather data sources with current weather conditions, daily forecasts, accurate hourly forecasts, real-time alerts, and historical weather data. With an API key, you can make weather data API calls by using open API standards. You can also integrate the APIs with applications and business processes to make actionable, data-driven decisions.

The APIs are curated to give you only what you need in the format you need it, including alerts, notifications, forecast data, weather imagery, and damaging weather. You can use the APIs to add value to your applications by incorporating weather data directly into your applications or into your own custom AI models.

The API key that you use to build your queries determines the number of API calls you can make:

**Trial key**
: The trial API key provides 50,000 API calls daily and 100 API calls per minute for internal development and nonproduction use. When the daily limit of trial API calls is reached, the key is unavailable for the rest of that day. The trial key is available for a limited time and is automatically unavailable when the trial period ends.

**Development key**
: The development API key provides 1,000 API calls daily for internal development and nonproduction use. The API calls do not count toward overall usage consumption. When the daily limit of development API calls is reached, the key is unavailable for the rest of that day.

**Production key**
: The production API key provides call volumes based on the purchased AppPoints in your contract. Minimum purchase includes 200,000 API calls per month for 10 AppPoints. Additional AppPoints can be purchased for increased usage.

- **Aviation APIs**
- **Current APIs**
  Use the Current APIs to get weather data related to current conditions, such as alerts, air quality, anc storm information.
- **Forecast APIs**
  Use the Forecast APIs to get weather data related to forecasted conditions, such as visualizations, time-based forecasts, precipitation, hobby-related indices, and forecast data for analytical tooling.
- **Historical APIs**
- **Utility APIs**
  The Location Service APIs provide the ability to lookup a location name or geocode (latitude and

longitude) to retrieve a set of locations matching the request.

- **Weather Imagery APIs**
- **Guides for Weather Data APIs**

  Refer to these guides to help you to interpret the APIs.
