The web-based air quality management platform

Kunak AIR Cloud is air quality measurement software that allows easy analysis of environmental data. It provides real-time access to the data collected by the network of sensors to enabling decision-making to improve the air quality of the environment and protect people's health.

The Kunak AIR Cloud web-based platform offers professionals a new way to operate the network, manage devices, configure alarms, calibrate and perform field operations remotely. It also provides a comprehensive suite of tools for air quality data analysis.

The web Kunak AIR Cloud software, in combination with the Kunak Air Pro and Kunak AIR LITE environmental monitoring stations, represents a perfect synergy in the field of air quality management. This union not only joins the individual capacities of each component, but also enhances them, achieving results that far exceed expectations. In simple terms, it's like saying that one plus one is greater than two.

It positions itself as one of the most advanced and powerful tools available on the market for environmental data processing. This combination allows users to leverage air pollution data quickly and easily, thereby supporting informed decision-making and facilitating the management, maintenance and calibration of air quality sensor networks.

Features and benefits of Kunak AIR Cloud

Kunak AIR Cloud is a professional online platform **designed for the remote management of air quality networks**. This advanced tool allows users to maximise the potential of data obtained by Kunak AIR monitoring systems and other external sources. By integrating and analysing this data, Kunak AIR Cloud provides a comprehensive solution that facilitates efficient and accurate analysis and management of environmental data.

Its intuitive and easy-to-use interface allows users to access detailed, real-time air quality information in various locations and is especially useful for companies or organisations that need to monitor multiple sites simultaneously. In addition, Kunak Air Cloud allows the customisation of reports and data visualisations, adapting to the specific needs of each user or project.

The SaaS model: Flexibility and efficiency

The operation of Kunak AIR Cloud is based on the **“Software as a Service”** or SaaS model. This approach, which is cloud-based, gives users all the tools necessary to extract the maximum performance from the data collected by the sensor network. In addition, being cloud-based, Kunak AIR Cloud enables the remote management of devices or device networks, thereby facilitating efficient, centralised control from anywhere with internet access.

One of the main advantages of Kunak AIR Cloud is its flexibility. The software can be contracted by **modules**, which means that users can select and pay only for the functionalities they really need. This means that users can customise the software to the specific needs of each air quality monitoring project, thereby optimising resources and costs. This model also ensures that the software is kept up to date with the latest improvements and functionalities, without the need for additional installations by users.

What distinguishes Kunak AIR Cloud from other options?

The market offers multiple tools to visualise and analyse data related to air quality. However, **few solutions match the level of performance and functionality of Kunak AIR Cloud**. By choosing this solution, you will benefit from:

- Reliability and security in data handling.
- A service focus, prioritising the response to our customers' needs and providing features such as the creation of user profiles with different levels of access.
- The ability to complement and facilitate decision-making.
- Thanks to its ease of installation and operation, it works perfectly on different devices (computer, smartphone, etc.).

- Thanks to its API, options to share data or integrate data into other apps, as well as the possibility of adding data from external sources for combined analysis.
- Its scalability adapts to the growth of your network of sensor-based stations (from Kunak or reference stations).
- The excellent technical support provided by Kunak.
- The continuous improvements allow us to enhance the service, with no additional costs.

In addition, when continuous and real-time air quality monitoring is within a network of Kunak AIR stations, Kunak AIR Cloud is key to:

- Configure the network of teams deployed in the field.
- Monitor the status of equipment and detect possible anomalies.
- Set alarms and warnings.
- Calibrate the sensors.
- Validate and invalidate data.
- Record all maintenance and network configuration tasks.
- And much more.

Packages available according to the needs of each customer

Contracting a package is an option that many companies usually choose. Basically, it consists of making the purchase options easier for the customer by reducing and classifying the product range into “packages” of services. Unsurprisingly, it has been shown that an excessive product range can cause indecision.

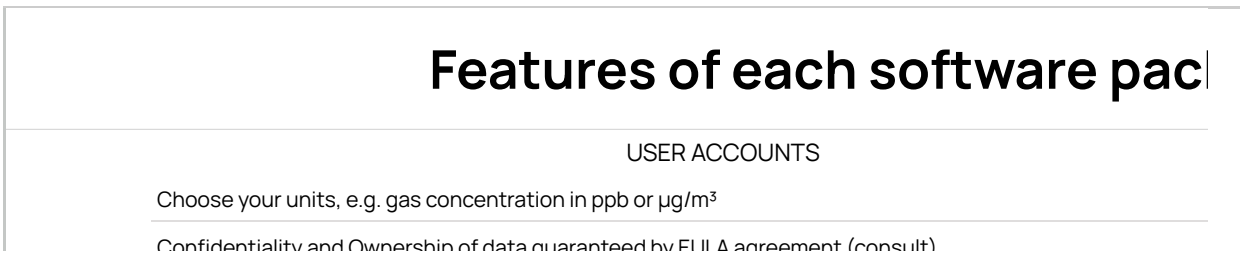

At Kunak we always seek maximum customer satisfaction and are aware of what the main market demands are. Therefore, we believe that packaging the services we offer through Kunak AIR Cloud can be a great way to provide you with high-value products and services that best suit your needs.

Their configuration is flexible, so it is possible to adapt the service to the available modules. This way, customers can select the package that best suits the needs of their project and make the most of the data provided by the sensor network. Customers can choose between the following packages:

- Initial
- Initial + Operation
- Initial + Analysis
- Complete

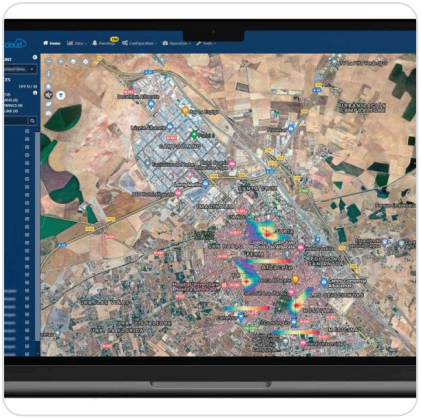

Below, we detail the features included in each of the packages:

Kunak AIR Cloud - Features of each software package : .

Main functionalities

Here is a sample of the main tools available on the platform. However, it includes many more that will facilitate your daily operations.

News about our cloud platform

As we mentioned earlier, our online platform is always up-to-date. This way, we ensure that customers enjoy any new tool or functionality immediately at no additional cost.

Updates are continuous. At the moment, version 2.3.0 includes some important improvements such as:

- The launch of the new app for Android.
- A new interface and improvements to advanced display layers (heat maps, pollution roses, particle distribution, etc.).
- A new section to update the firmware on the devices.
- The creation of widgets and personalised web pages to share publicly.
- An option to view the historical location of the devices.
- The generation of reports in Spanish.
- The functionality to add lines to charts in the standard data section.
- Improvements in account creation.

- Notifications via email.
- Maintenance suggestions and help with problem-solving.
- A visual log that allows you to see where, when and how the device has been installed.
- Additional advanced statistics and graphs.
- Portuguese and French language texts have been added.
- The download of cartridge certificates.
- The option to download the certificate for each cartridge.

Sectors where to use the Kunak AIR Cloud software

We have described some of the key functionalities of Kunak AIR Cloud air quality software and some of the improvements we have been implementing.

However, we should also highlight some of the activities that may benefit from the tool in order to monitor facilities or areas of influence for air quality measurement:

Urban

The comprehensive solution consisting of Kunak AIR stations and the Kunak AIR Cloud platform is the perfect complement to the reference station networks found in cities. This combination extends the coverage and accuracy of measurements, helping to **identify air pollution and noise hot spots** and increasing data availability.

It is a fundamental tool for cities that want **to improve the quality of life** of the public through innovative technologies. For example, it is recommended to use it in the control of Low Emission Zones (LEZs) that more and more cities are implementing. The measurement of air quality is

also a necessity (and depending on the city, a regulated obligation) in demolition works and new builds, as we indicated in the project for the demolition of the old football stadium of Santiago Calderón.

Industries

Kunak's hardware and software combination enables the **monitoring of industrial perimeters** to detect fugitive emissions or, in the case of wastewater treatment stations, to control the release of compounds that generate odour pollution. In the case of seaports and as part of initiatives that seek to enhance the sustainability of these infrastructures (Green Ports or Green Port projects), the monitoring of pollution levels has also acquired great importance in order to reduce the environmental impact of port operations and ensure the well-being of workers in the port and the inhabitants of the area.

Ports and Airports

Environmental monitoring is an indispensable tool for pollution control in maritime and air transport. These systems allow real-time measurement of emissions from ships and aircraft with exceptional accuracy, making it easier to identify the main sources of pollutants to control air emissions. Some projects where we are located are the port of Neom in Saudi Arabia, the ports of the Balearic Islands in Spain and the port of Cotonou in Benin. With the data provided by sensor networks, it is possible to design and implement more effective strategies to mitigate the environmental impact of port activities by driving innovation and sustainability in ports.

Construction

Thanks to the information provided by our air quality measurement solutions, the advanced Kunak AIR Cloud system allows access to accurate measurements of dust and polluting gas emissions from construction sites. This data provides reliable information through which construction companies can identify and control the pollution they are generating. Our technology enables validating actions that reduce their environmental footprint while protecting public health and complying with environmental regulations.

Mining

Mining is an industry that can generate high levels of air pollution due to its extraction and transport processes. Kunak AIR Cloud software is an essential tool in this sector as it allows **real-time air quality monitoring**, providing accurate and reliable data that helps mining companies **comply with environmental regulations and protect the health of their workers**. Thanks to its remote monitoring capability and detailed reporting, many companies have been able to reduce their production costs by detecting anomalies, through maintenance work and improving regulatory compliance.

Research and consulting

Our software facilitates the analysis of air quality data, allowing researchers to gain actionable insights for their studies. This not only improves the accuracy of the studies, but also increases the customer's confidence in the results obtained.

In addition, environmental consultants can **offer their customers solutions based on accurate and up-to-date data**. In environmental impact assessment projects, this software has enabled consultants to

conduct comprehensive analyses and submit reports that meet the highest quality standards.

Why do I need a platform like Kunak AIR Cloud?

If you have read this article carefully so far, it is easy to understand that you have come to the following conclusion: **It's important to have quality data, but what use is it if you do not have the necessary tools to analyse them and make decisions based on them?**

Wireless sensor networks can generate a large volume of data that grows over time (1). And this information influences decision-making such as:

- *Should I activate the high pollution level protocol?*
- *Should I improve primary care in response to a possible increase in the number of medical consultations due to the forest fire that is 20 km from the city?*
- *What impact could these pollutants have on architectural heritage?*

The answer to these questions also depends on the information available. It is obvious that the quality of the monitoring instrument, its location and the density of devices influences analysis. In this regard, our Kunak AIR stations offer excellent reliability. But it is also true that **having the right tools allows us to "digest" these raw data and extract their full potential from them**, adding functionalities such as setting up alerts or data validation.

Kunak AIR Cloud not only provides a robust platform for **data storage, visualisation and analysis**, but also offers an **intuitive and easy-to-use interface**. This allows users to access information quickly and efficiently, facilitating informed decision-making. In addition, as the platform is

scalable, it adapts to an increasing volume of data without compromising performance.

How are our customers using the software?

Air quality monitoring in mines

The Caribbean energy generator and distributor, Gecelca S.A E.S.P, required an air quality monitoring system at the Las Palmeras coal mine in Córdoba, Colombia. To address this need, a hybrid air quality network was deployed, consisting of 3 Grimm EDM180 mobile stations for PMS measurement and 3 Kunak AIR Pro stations for measuring pollutant gases and PMs. Kunak AIR Cloud software was key in this project as it enabled the management of information collected by the sensor network, and allowed for advanced analysis of the data to aid decision-making.

Air quality monitoring and thermal stress during sports

At the World Athletics Championships in Budapest 2023, the World Athletics Association committed to recording air quality throughout the event. Kunak was hired to control thermal stress with the development of a specific WBGT probe as well as to monitor air pollutants. This allowed athletes to be informed about the pollutants to which they were exposed. Additionally, the data could be accessed live thanks to the development of an embedded widget on the World Athletics website.

Conclusion

Poor air quality is a problem that only becomes noticeable when pollution levels rise. But people's health can be harmed even by continued exposure to pollutants within legal limits. Numerous studies have shown, in fact, that there is no safe level for pollution.

The continuous monitoring of atmospheric variables is therefore a way to reduce the consequences of this threat. It involves relying on advances such as the Kunak AIR Cloud online platform, and software designed to get the best performance from Kunak air quality stations. This combination of tools comprises our vertical air quality measurement solution. On the one hand, the award-winning Kunak AIR Pro and Kunak AIR Lite. On the other hand, the powerful Kunak AIR Cloud online platform. Together, they provide the best option to take the right actions and ensure good air quality.

Because as Snyder *et al* (2) say,

> "*data of poor or unknown quality is less useful than no data, as it can lead to wrong decisions*."

You have the last word.
